

DS-I Africa: Tool-a-thon

Sunday, 24 August 2025

IBM Granite Geospatial Land Surface Temperature (LST) Model Instructions

Welcome to the tool-a-thon activity, Day 2. For this activity you will prepare LST predictions for a city of interest and proceed to analyze human mobility trends for the given period.

You will use compute infrastructure available on Google Colab: <https://colab.google>

The original [IBM granite-geospatial-land-surface-temperature](#) GitHub repo has been adapted in the below for this tool-a-thon.

Getting set up

1. On the web browser navigate to [Google Colab](#), select Open Colab

2. You will see options for opening a notebook, select GitHub from the options on the left
3. Paste the following repository link in the GitHub URL tab:
<https://github.com/Tamaragov/dsi-toolathon-2025-granite-geospatial-land-surface-temperature.git>

And ensure the same repo is selected below with branch: “main”

4. On the last tab “Path”: Scroll down to select notebooks/DSI-tasks.ipynb. Click the launch icon next to this notebook.
5. You may now follow instructions on this notebook to complete the tasks for this portion of the tool-a-thon. The final dataset you produced would need to be downloaded to the desktop of the machine you are using or to a google drive folder.
6. If you were unable to reproduce/download the final dataset, you can download it from Box: <https://ibm.box.com/v/predictions-dsi-final>
